X-Bees are now working like they should
** It was a problem with the coordinator sending its message to every Xbee instead of a specific one, but now I can send it to a specific one

* We soldered a DIP slot and some resistors into the ROM Plug-In board for use in testing
** However we have to unsolder these elements as the board has to be modified a little to house the hall effect sensor

Things to be done:
* We need to perform further testing
* The script for the Raspberry Pi to run the Xbees correctly will be written within a day
