This week I worked on testing the Audio circuit and I am unable to get the audio circuit to work, I can get it to work with using the input from the computer, but when it goes through the circuit, it appears to short out the signal. The speaker works with input from the computer, its just not very loud. I have to go through the pcb and test the different connections and different points, because the circuit worked fine on a breadboard. I also helped Jeong test the circuit that divides the voltage between the different components.
