This week, I modified Brad's cooling circuit on Eagle so he can take it to Mr. Chris O'Laughlin next week to get another cooling circuit PCB made. I also tested the power output circuit and helped Ryan with the audio circuit. The problem I was having while testing the power output circuit was that the outputs were dropping voltages when I connected component(s). I've been trying to figure out why this was happening, and I think I may need to redesign the circuit with a voltage regulator before each output.
