This last week before our Final presentation has been spent finishing up our design and tidying up the GUI. Early in the week we met in the ERAD building and put together the strap and lids on our device, and updated all them. Individually I've spent time with the GUI making it nicer looking, and adding a few new functions. One of which is the ability to enter weight and a height and then determine the work done. The other tells the average resting heart rate and the average active heart rate. The new GUI layout can be seen in the attached pictures. In this last week to come, I will be working on actually displaying the averages heart rates to the GUI, and getting the device to calculate the power as well.
