Last week we finished constructing the Display Box. The sides and the top of the box are made out of Plexiglas. The base board, which is made out of wood, is where all of the circuitry with exception of the primary and secondary coil will be attached. The base board is not attached to the Plexiglas box to make the circuitry accessible during the construction phase. We also left one of the Plexiglas sides off for accessibility if we have an issue during operation. The box is put together and will be displayed tonight at the first milestone presentation.
