Eric and I worked on the speedometer. We used a power supply in the lab and wired the circuit. Once it was wired to the Arduino we ran the program. At first it was not working, after playing with the code we were able to get it to properly detect and display the correct the speed and mileage. We also worked on the dimmer this week. We wired the circuit and connected it to the Arduino also. Using the AnalogWrite() code we were able to get the dimmer to work. We recorded videos of both of them working and showed them at the Milestone1. I have also been in contact with a solar panel company about sponsorship, but they do not have any extra budget to sponsor us.
