### Description:
This week we met as a group and discussed our PCB board design. We think we will only need 1 board for all of our circuits, but we are making sure all of our circuits work on breadboards first before we spend the money on a PCB board that could potentially have an incorrect design. I also have continued coding the RFID board and I am also trying to help Eric get the display working.

The rest of this week I will continue working on the RFID system, and also continue figuring out the receiving circuit for the backup sensor.
