During this past week we built a stand to hold the sound source. The stand consisted of one eight foot long 2” x 4” and four one foot long 2” x 4”s screwed together to make the base. We then measured and marked two foot increments along the length of the eight foot long 2” x 4” to give us consistent heights during our sample data base build. This completed the construction of our test space minus the mounts for our microphones.
