Wednesday the group got together to attempt getting our motor up and running. I focused on the code while the rest focused on the circuitry. After initial attempts, we continued to burn up parts. This was initially due to wrong connections. Upon further inspection, the ratings of certain components were not capable for the power we were attempting to consume.

On Thursday, Josh and I attempted once more to get things running but again were not successful. Simply continued to burn more parts.

For Monday we are aiming to have high rating diodes, and more mosfet or bjts to disperse the current of our power supply more. If our supply can not handle the 4 amps after Monday, we will redesign the supply to maybe a known working example.
