Subject: Porting to java

Description: The HTK tool kit is written in C++ but the Android operating system is written in java. In order to use the voice recognition program that I wrote in C++ I had to convert it to Java. Java has a similar syntax like C++ so porting should have been easy. But this is not the case, even when using the converter tool some of syntax of the new code does not compile right. So instead I have to rewrite some the code so that the program could work. I think the process of rewriting the code into java will take longer that anticipated.
