Monday Nov 12, met as a group and tested the 8ft plane of our sample point database and work on fully integrating the code. Was not happy with the accuracy of our 8 ft plane. We are going to have to redo it.

Wed Nov 14, Still having problems with 8ft plane. Believe it has to do with the fact that our top mics are also at 8ft. I don't believe our code can handle this well due to the fact that a sound above the mics and a sound below come out the same in the math. So we are going to switch to the 7.5 ft plane so we are always below the mics. Built the 7.5ft plane.

Thurs Nov 15, tested 7.5ft plane and it works well... So we just need to fix a few sample points and our database will be complete.
